| 6. Printing on the standard output.....          | 4 |
| 6.1. Most used format placeholders .....         | 4 |
| 6.2. Usage of function printf .....              | 4 |
| 7. Operators .....                               | 5 |
| 7.1. Arithmetic operators.....                   | 5 |
| 8. Problems.....                                 | 5 |
| 8.1. Problem 1.....                              | 5 |
| 8.2. Problem 2.....                              | 6 |
| 8.3. Problem 3.....                              | 6 |
| 8.4. Problem 4.....                              | 6 |
| 8.5. Problem 5.....                              | 7 |
| 8.6. Problem 6.....                              | 7 |
| 8.7. Problem 7.....                              | 8 |
| 8.8. Problem 8.....                              | 8 |
| 9. Source code of the examples and problems..... | 9 |

# 1. Simple C program structure

All the source code written in C is organized in **functions**

```
int main() {  
    variable_declarations;  
    expressions;  
}
```

## 2. C Functions

- `main` - C **main** function
- In parentheses ( ) we put the input arguments
- The return type of the functions is before the name (`int` – the function returns integer)
- The function body starts with {, and ends with }
- All declarations and expressions are separated with ;

## 3. Comments usage

Comments are used for extra explanation or documenting the source code. C supports two types of comments:

- one line comments that start with double slash //

```
// comment in one line
```

- multiple line comments that can span across multiple lines and start with /\* and end with \*/

```
/*  
Longer comment  
in multiple  
lines  
*/
```

### 3.1. Example (Hello world)

## Example 1

```
#include <stdio.h>

// main function
int main() {
    /*
     * Printing a message on the standard output (the screen)
     */
    printf("Welcome to FINKI!\n");
    return 0;
}
```

- `#include` - directive for including external libraries
- `stdio.h` - library for accessing standard input/output streams (keyboard/screen)
- `printf` - function for printing on the standard output (screen)

## 3.2. Program for summing two integers

### Example 2

```
#include <stdio.h>

int main() {
    int a = 5;
    int b = 10;
    int c = a + b;
    return 0;
}
```

## 4. Variables

- Variables are symbolic names for places in memory where are stored some values.
- Before using it, each variable must be **declared**.
- With each assignment of new value, the old value in the variable is lost.

### 4.1. Declaring variables

```
data_type variable_name = initial_value;
```

#### Example

```
int a = 5;
float x = 2.3;
char c = 'a';
```

## 4.2. Data types in C

| Integers | Characters | Real numbers |
|----------|------------|--------------|
| int      | char       | float        |
| short    |            | double       |
| long     |            |              |

## 4.3. Defining variable names

In naming variables you can use:

- lowercase letters from a to z;
- uppercase letters from A to Z;
- digits from 0 to 9 (the name can not start with digit);

When choosing a variable name, pick ones that clearly describe the value they store.

C is **case sensitive**

## 5. Named constants

Names constants are created using the keyword `const`

### Example 3

```
#include <stdio.h>

int main() {
    const long double PI = 3.141592653590L;
    const int DAYS_IN_WEEK = 7;
    const SUNDAY = 0; // by default int
    DAYS_IN_WEEK = 7; // error
    return 0;
}
```

Named constants can be created also by using the preprocessor and with all uppercase letters by convention.

Using `#define`

```
#define TEXT_TO_SEARCH_FOR REPLACEMENT_TEXT
```

*Example 4*

```
#include <stdio.h>
#define PI 3.141592653590L
#define DAYS_IN_WEEKS 7
#define SUNDAY 0

int main() {
    long number = PI;
    int day = SUNDAY;
    return 0;
}
```

## 6. Printing on the standard output

For printing on the standard output (screen) in C we use the function `printf` from the library `stdio.h` (**Standard Input Output**)

```
#include <stdio.h>
```

The signature of the function is:

```
int printf(control_array, list_of_arguments)
```

The *control array* contains text of any kind, and format placeholders with leading `%` or special characters with leading `\`.

The *format placeholders* are determined from the variable type we want to print.

### 6.1. Most used format placeholders

| Format          | Usage  |
|-----------------|--|
| <code>%d</code> | integers ( <code>int</code> )                                  |
| <code>%i</code> | integers ( <code>int</code> )                                  |
| <code>%f</code> | real numbers ( <code>float</code> , <code>double</code> )      |
| <code>%c</code> | characters ( <code>char</code> )                               |
| <code>%s</code> | characters (строка, <code>char[]</code> , <code>char*</code> ) |
| <code>%%</code> | character <code>%</code>                                       |

### 6.2. Usage of function `printf`

Print on the standard output the following sentences:

```
First sentence.  
Second sentence.  
Third sentence.
```

### Example 5

```
#include <stdio.h>  
  
int main() {  
    printf("First sentence.\n");  
    printf("Second sentence.\nThird sentence.\n");  
    return 0;  
}
```

### Пример 6

```
#include <stdio.h>  
  
int main() {  
    printf(" is a word long %d letters.\n", printf("Macedonia"));  
    return 0;  
}
```

## 7. Operators

### 7.1. Arithmetic operators

Are used on numbers (integers or real)

| Operator | Operation                       |
|----------|---------------------------------|
| +        | Addition                        |
| -        | Subtraction                     |
| *        | Multiplication                  |
| /        | Division                        |
| %        | Modulo (residue after division) |

## 8. Problems

### 8.1. Problem 1

Write a program that will compute the value of the mathematical expression:  $x = 3/2 + (5 - 46 \cdot 5/12)$

## *Solution 1*

```
#include <stdio.h>

int main() {
    float x = 3.0 / 2 + (5 - 46 * 5.0 / 12);
    printf("x = %.2f\n", x);
    return 0;
}
```

## 8.2. Problem 2

Write a program that for given value of x (during the declaration) will compute and print the value of  $x^2$ .

## *Solution 2*

```
#include <stdio.h>

int main() {
    int x = 7;
    printf("Number %d squared is %d\n", x, x * x);
    return 0;
}
```

## 8.3. Problem 3

Write a program that for a given sides of one triangle, it will print the perimeter and area of the square (values are a = 5, b = 7.5, c = 10.2).

## *Solution 3*

```
#include <stdio.h>

int main() {
    float a = 5.0;
    float b = 7.5;
    float c = 10.2;
    float L = a + b + c;
    float s = L / 2;
    float P = s * (s - a) * (s - b) * (s - c);
    printf("Perimeter is: %.2f\n", L);
    printf("Area is: %.2f\n", P);
    return 0;
}
```

## 8.4. Problem 4

Write a program for computing the arithmetic mean of the numbers 3, 5 and 12..

*Solution 4*

```
#include <stdio.h>

int main() {
    int a = 3;
    int b = 5;
    int c = 12;
    float as = (a + b + c) / 3.0;
    printf("The arithmetic mean is %.2f\n", as);
    return 0;
}
```

## 8.5. Problem 5

Write a program that will print the remainder from the division of number 19 with 2, 3, 5 and 8.

*Solution 5*

```
#include <stdio.h>

int main() {
    int a = 19;
    printf("The residue of division with 2 is: %d\n", a % 2);
    printf("The residue of division with 3 is: %d\n", a % 3);
    printf("The residue of division with 5 is: %d\n", a % 5);
    printf("The residue of division with 8 is: %d\n", a % 8);
    return 0;
}
```

## 8.6. Problem 6

Write a program for computing and printing the circle area and perimeter. The circle radius is read as decimal number.

*Solution 6*

```
#include <stdio.h>
#define PI 3.14

int main() {
    float radius;
    scanf("%f", &radius);

    float perimeter = 2 * radius * PI ;
    float area = radius * radius * PI;
    printf("L = %f\n", perimeter);
    printf("P = %f\n", area);
    return 0;
}
```

## 8.7. Problem 7

Write a program that reads from standard input two integers and prints their sum, difference, product and division remainder.

### *Solution 7*

```
#include <stdio.h>

int main() {
    int x, y;
    scanf("%d %d", &x, &y);

    printf("%d + %d = %d\n", x, y, x + y);
    printf("%d - %d = %d\n", x, y, x - y);
    printf("%d * %d = %d\n", x, y, x * y);
    printf("%d %% %d = %d\n", x, y, x % y);
    return 0;
}
```

## 8.8. Problem 8

Write a program that reads uppercase letter from standard input and prints out in lowercase.

Each character is represented with its ASCII code.

### *example*

```
A = 65, a = 97
```

### *Solution 8*

```
#include <stdio.h>

int main() {
    char c;
    printf("Enter an uppercase letter: ");
    scanf("%c", &c);
    printf("%c lowercase is: '%c'\n", c, c + ('a' - 'A'));
    return 0;
}
```
